

Clear Cache for one Website Google Chrome

If you need to clear the cache for one specific website in Chrome, Google has made this possible in the developer tools.

Although Chrome already has a built-in tool in settings that allows you to purge the cache from the last hour, 24 hours, 7 days, 4 weeks, or all time, they don't make it easy for you to purge the cache for one particular website.

No other article shows you how to wipe the cache for one website, their [steps are outdated](#), and they only show you how to clear cached images and file for every website you've visited.

Clear the Cache for one Website

1. Go to the **website** you want to **clear** the **cache** for
2. Hold **Ctrl + Shift + I** shortcut to open the **Chrome developer tools**
3. **Right-click** the **refresh button** next to the address bar
4. Click **Empty Cache and Hard Reload** in the options

The cache for the single website should clear in Chrome.

Remember that developer tools must be open for you to see the option when you right-click the refresh button.

If you do this without opening the developer tools, there won't be any options available when you click the reload button.

This method is the only way to clear the cache for one website in Google Chrome – going to settings > Clear browsing data > Cached images and files wipes the cache for every site you've visited within a specific time frame, not a particular website.
